1 | def of a vector space

• Props of addition and scalar multiplication in F^N

- $+$: comutative, associative, identity
 - every element has an additive inverse
- $*$: associative, identity
- addition and scalar multiplication, connected by distributive props
- let V be a set with an addition and scalar multiplication that satisfy the props,

****addition, scalar multiplication****

- addition: assigns an element $u+v$ in V to each pair of elements u, v in V
- scalar multiplication: lv with l in F and v in V

****vector space****

is V with addition and SCMUL with:

- commutativity
- associativity
- additive identity
- additive inverse
- multiplicative identity
- distributive properties

- no multiplicative inverse?
 - is this how you solve the 0 issue?
- vec, point
 - elements of vec space are called vecs or points
- simplest vec space: $\{0\}$
- F^∞ is the set of all seqences of elements of F
 - additive identity: seqence of all zeros
- vector space can include a set of functions? not quite..
 - let S be a set, and F^S be the set of functions from S to F
 - what?? #review
- let S be the interval $0,1$ and $F=R$
 - $R^{[0,1]}$ is the set of real valued function on the interval $0,1$
 - ??
- $F^N \rightarrow F^{\{1,2,\dots,n\}}$
- $F^\infty \rightarrow F^{\{1,2,\dots\}}$
- vector spaces need unique additive inverse
 - $0'=0'+0=0+0'=0$
 - nicer than my proof

- unique additive inverse
 - $w = w + 0 = w + (v + w') = (w + v) = (w + v) + w' = 0 + w' = w'$

V denotes a vector space over F

1. no multiplicative inverse required?
2. what does the set of functions from S to F mean?

1.1 | exercises

1. prove that $-(-v) = v$
 1. $-(-v) = -1(-1v) = (-1 * (-1))v = 1v = v$
2. $ab = 0$, prove that a or $b = 0$
 1. $a=0/v = 0, v=0/a = 0$
3. empty set is not a vector space, it fails to satisfy only of the reqs. which one?
 1. no additive identity
 1. "there exists an element 0 in v " no there doesn't.
